- Study of Hematology We found that recombinant TXN could be incorporated into leukemia treatment regimens as a novel approach to reduce oxidative DNA damage and further mutations.
- Contributing to solving priority problems locally, regionally and internationally in scientific and application, and spreading the culture of scientific research, in the field of medical and health sciences to study changes in the genes of the body's immune system, the latest important branches to know the causes of cancer and to determine the causes of its spread and/or lack of response to treatment or that it may Cancer Receding, these studies I did based on my passion for Biochemistry "Genetics" ... compatible with international research and scientific trends.
- I have adopted in my studies and research the interest in genetic studies and their relationship to obesity and the consequences of diabetes or liver diseases from liver fatness or various digestive diseases to pancreatic cancer, as well as the genetic effect and its changes on the response of stroke and heart patients.
- How the genetic changes or gene expression affect the response of leukemia patients, which reflects the importance of genetics, the importance of genetic markers, and knowledge of each individual's genetic map to reduce the side effects of taking drugs that will not be effective for one patient than another.
- Scientific research related to genetics that serve the health and medical sciences and push towards finding solutions to practical problems on the ground.
- Studying the reasons why some patients respond to treatment and not others, and some may not tolerate the side effects of some cancer treatment drugs, all of this and that have genetic and immune causes.
- To investigate the relationship between alpha-1 gene expression and the diagnosis and prediction in adult Egyptian patients with acute leukemia, and to search for new and advanced mechanisms to develop a new treatment strategy in acute leukemia in adults.
- A study of the biological and immunological signs and their relationship to non-communicable diseases such as liver cancer, blood cancer, obesity, or cardiovascular

diseases, in addition to genetic studies to find out the causes of liver cancer or leukemia and the relationship of gene mutations and their sciences with the vital signs and immune connotations and their relationship to non-communicable diseases.
